Organization of train traffic and railway station operation

Mathematical Centre Ltd. <u>mathcenter.com.ua</u> <u>company@mathcenter.com.ua</u>

Organization of train traffic and railway station operation

GRAPHIC-ANALYTICAL SYSTEM (GAS)

information support of problems of optimization of traffic volumes and calculation of basic elements of the train schedule;

formation and editing of the scheme of the railroads and development of schemes of stations;

formation of information models of objects of the railroad and rolling stocks;

development of regulatory base for the solution of problems of planning and optimization

TRACTION, POWER AND THERMAL CALCULATIONS

calculation of optimum parameters of train movement for the set criteria;

calculation of adaptive parameters of movement models and models of mode movement control of trains (calculation of real traction and power characteristics of locomotives and basic parameters of rolling stocks);

calculation of design parameters for building ways for the set mode of train movement;

calculation of thermal characteristics of locomotive drives for the set or calculated mode of train movement;

calculation of the characteristic of additional traction for trains with the set parameters and the calculated modes of their movement;

creation of functional dependences between traction, fuel and energy, time, high-speed and other parameters of trains and modes of their movement;

formation of optimum restrictions on movement speed on certain sections or their parts for set time of a train movement;

automation of process of formation of operational regime cards of train operation

BUILDING OF THREADS OF TRAIN SCHEDULES

calculation of times of stages for the set criteria;

calculation of intertrain and station intervals of train movement;

creation of standard train schedules;

automation of process of creation of train schedules taking into account "windows" on a way of train movement;

automatic building of train schedules for different categories which have individual regime parameters of a movement, lengths or weight;

manual updating of the train schedule;

train schedule building based on economic criteria of a choice of its standards and indicators;

system development optimum adaptive automatic train operation on the basis of operating identification of real traction and power characteristics and on the basis of high-precision forecasting of parameters in the course of its movement;

automation of process of identification of available "safety intervals" of routes on arriving and departure of passenger trains

OPTIMIZING TASKS

Calculation:

- the most allowable mass of the train and its regime parameters;
- modes of the train movement with the minimum total power costs;
- the combined traction (a set of locomotives) which will provide the minimum power costs;
- dependences of the weight, time of movement and power costs of the train for various types of locomotives;
- costs of the schedule of the created (standard) train at existing cost rates.

Building of a thread of the schedule for the concrete train using the specified criterion of optimality

Finding of an economic assessment of change of train schedules

Creation of restrictions (on not set sections) on the speed of train movement using the specified criterion

DEVELOPMENT OF OPERATING AND LONG-TERM PLANS OF FORMATION OF TRAINS

- A number of cars described in a starting and technical routing documentation;
- A length of the run without processing;
- A total cost for accumulation, an idle time of cars in the course of processing and placement in transit trains without processing;
- A number of cars processed at technical stations;
- Effective use of processing capacity and sorting means of stations;
- A number of the trains formed at stations, networks of the railroads as a whole

Creation of the optimum plan of formation using:

- A dynamic matrix of correspondence of cars (with freight and without freight) between stations;
- A dynamic matrix of expected requirement for cars;
- A dynamic matrix of readiness of cars to depart;
- A schedule of movement of passenger and cargo trains;
- A residual traffic and processing capacity of stages and stations;
- Normative and calculated rates of costs;
- A criteria of an optimality of the join of car flows

Information basis:

CALCULATION OF AVAILABLE CAPACITY OF THE RAILROAD

capacity of track sections on stages;

capacity of stations (on yard neck, sorting hump, etc.);

capacity of carriage and locomotive farms;

capacity of the main constructions and devices;

calculation of capacity of traction power supply;

calculation of available traffic and transportation capacity of railway lines

TECHNOLOGICAL PROCESSES OF STATION OPERATIONS

Development of the unique base of typical technological processes of station operation and software tools for system of automatic formation of technological processes of station operation, operation of groups of technologically related stations.

Development of dynamic model of interaction of technological processes of station operation, operation of groups of stations for operational decision-making system.

Calculation of productivity parameters, technical and economic estimates of its operation; potential of optimization of traffic and processing capacity of stations.

System of dynamic planning and forecasting, imitating modeling of station operation using the specified optimality criteria.

System of information support of databases of operations of interactions of the technological typical and created processes.

Software and graphic tools of automatic formation of technological processes of stations and representation of technological processes

INFORMATION BASIS FOR TECHNOLOGICAL PROCESSES OF STATION OPERATION

database of typical operations and technological processes of station operation and system of development and updating of technological processes of stations;

dynamic model of interaction of technological processes of station operation for operational decision-making system (optimum planning and forecasting of station operation);

uniform information system of technological processes at Ukrzaliznytsya

PROJECTS IN THE PIPELINE

Developing:

- concepts of automation of scheduling and forecasting the need for car and train traffic volume in order to find the most optimal management strategy for transportation and putting trucks together at Ukrzaliznytsya;
- the application software for across-the-board stage-by-stage transition of the railroad to automated system of regular and on-line scheduling the trains;
- the common set made of typical technological station operation routines and software tools for automation system which forms technological operation routines for station, as well as groups of them;
- dynamic model of interaction of technological station operations, used as the base for on-line decision-making system;
- regular and on-line timetables guidelines for the automated system which forms timetables;
- the automated system for formation and maintenance of regulatory base for development of regular train schedules;
- systems of calculation of capacity of traction power supply in the environment of graph analytical system;
- automated train scheduling;
- railway operator environment for drawing up drafts of formation of trains;
- short-term and long-term plans for train formations;
- systems of optimum adaptive unmanned train handling (based on recent data calculation in operation, taking into account real traction and power, resistance characteristics, technical condition of a rolling stock and influence of external factors) on the basis of high-precision forecasting of parameters of movement in operational conditions;
- available traffic, transportation capacity of railway lines

Power inputs - travelling time (with minimal needed time taken away) curves for different railway sections and trains: (axis Y - power inputs expressed in kW; axis X - that time in minutes)
